Introduction

Neonatal intertrigo is an inflammation of the skin folds, of irritant or infectious aetiology. Neonates and infants are more predisposed towards intertrigo as they have abundant subcutaneous tissue which prevents the folds from airing out. Prolonged contact with an irritant, mainly detergents, urine, faeces and fragrances, affects the skin properties and enhances permeability to exogenous materials, thus increasing transdermal permeability and susceptibility to friction. Therefore, friction between the skin folds, coupled with maceration, due to reduced evaporation of sweat and overgrowth of bacteria (S. aureus, Strep. pyogenes) and fungi (Candida albicans), contribute to the development of erythema, pruritus, maceration and erosions, which may be quite persistent. Therapeutically, gentle cleaning, keeping the affected area dry, and topical barrier agents (zinc oxide paste) can be very effective. In some cases, imidazole lotions and antibacterial agents, such as mupirocin cream, and topical corticosteroids may also be administered. However, the importance of prevention, in terms of cleanliness, dryness and use of protective barriers, should be always stressed (1-3).

Intertrigo, as a term, comes from the Latin words “inter” which means “in between”

Objective. Confirmation of knowledge of neonatal intertrigo in ancient Greek and Byzantine medicine. Method: A search of Thesaurus Linguae Graecae was conducted with the following terms as key words, “syggama”, “xyggauma”, “paratrimma” and “ektrimma”. Results: Ancient Greek medico-philosophers introduced therapeutic measures based upon herbs and minerals, while a similar therapeutic approach was also used by the Byzantines. Hippocrates of Kos (460-377) was among the first to introduce written instructions, also proposing preventive treatment with palliative and aromatic herbs. Cataplasms, thalassotherapy, and fumigation were used, combined with hygienic measures in the affected area. Chalk powder was also prescribed to absorb moisture. Conclusion. The main principles in the treatment of intertrigo remain the same, celebrating the ancient Greeks’ methodology and rationalism.
and “terrere” which means “to rub” (4). It was a well-recognized affliction in Ancient Greece, as Hippocrates (460-377) and his followers were among the first authors to describe it, in the “Corpus Hippocraticum” (5). The terms used by the Greek medico-philosophers in antiquity were “syggama” (Greek: σύγκαμα) or “xyggauma” (Greek: ξύγκαυμα), which means “friction burn”, “paratrimma” (Greek: παράτριμμα), which means “rubbing between two surfaces” and “ektrimma” (Greek: έκτριμμα), which means “a lesion caused by friction” (6).

With the goal of discovering the knowledge of the ancient Greeks and Byzantines regarding intertrigo, our study gathers all the text fragments found in the TLG (The-saurus Linguae Graecae), a digital collection of surviving texts written in Greek, after a search using those terms as key words.

**Neonatal Intertrigo in Ancient Greek and Byzantine Dermatology**

Neonatal intertrigo has been recognized since antiquity, and ancient Greek physicians proposed various therapeutic approaches (6). In the 5th century BC, Hippocrates and his followers first mentioned the importance of prevention, and proposed cataplasms based on a mixture of aromatic herbs (On Diseases, 4th Book) (7). Furthermore, he introduced seawater bathing, or steam bathing (boiled seawater) for alleviation of pruritus (On the Use of Liquids) (8). In his opinion, precautionary measures should be administered soon after birth to avoid intertrigo (Greek fragment: Επη τα παιδα γέννηται, ψωμίζουσιν αυτά φάρμακα... και μη ξυγκαυθή) (7).

Centuries later, the distinguished Greek pharmacologist and leading expert in therapeutic botany, Dioscorides (40-90) proposed, for treatment of intertrigo, a mixture of Myrtus communis, Lycium barbarum, Plumbago capensis, chalcopyrite, white lead, and litharge. A palliative watery poultice was used as a cataplasm; aromatic oils, or even a powder of minerals and dried natural herbs were also applied (9). Dioscorides’ view was adopted by Galen (130-201), who was considering litharge to be an amazing “remedy for the human flesh” (Greek: σαρκωτικό) (On the Composition of Drugs According to Places) (10). In his turn, the Byzantine physician Oribasius (320-400), having mentioned both Dioscorides’ and Galen’s views, suggested that intertrigo lesions “should be covered with dry Myrtus, Cyperus Rotundus and rose hip, all stirred with some aroma” (Greek fragment: Τα δε κατά μηρούς εκτρίμματα μυρρίνη ξηρά διαπάσσεσαι και κυπέρω και ρόδοις προσμίγουσάν τι των ορομάκτων) (11). The famous Byzantine physician and medical writer, Aetius of Amida (502-575), proposed exactly the same treatment (Greek fragment: Μυρσίνην ξηράν λείαν επίπασσε, η κύπερον μετά ρόδων) (12). Paul of Aegina (625-690), whose paediatric work was based upon Oribasius’ treatise, also had the same opinion. According to his work, he proposed the topical application of “Balaustium” (Greek: Βαλαύστιον, Latin: Punica granatum, varietas plena major), the double flowered pomegranate tree, a plant with astrin gent properties in its bark, leaves and blooms, to cure intertrigo (13).

Oribasius and the Arab-Islamic physician Al Rhazi (854-925) mentioned that Soranus of Ephesus (98-138), the founder of obstetrics and gynaecology, and an expert in paediatrics, had dealt with neonatal intertrigo in his treatise entitled “On the care of the small child” (Greek: Περί κομιδής παιδιού, Arabic: Tadbir al atfal) (11, 14). In his turn, Avicenna (980-1037), adopted and proposed the ancient Greek treatment for intertrigo in his masterpiece, “The Canon of Medicine” (Arabic: al-Qanun fi al-Ṭibb) (15, 16). Centuries later, the Swiss physician and alchemist Philippus Aureolus Theophrastus Bombastus Von Hohenheim (1493-1541),
known as Paracelsus, mentioned in his work that the ancient Greeks used herb Helleborus niger (Ranunculaceae family), a well-known plant in antiquity, to treat skin irritations such as intertrigo (17). A reference was also made to its rose like flowers, while no other such citation is available.

Discussion

Ancient Greek medico-philosophers divided cutaneous diseases into psoriasic, leprotic and leichen. The term psora referred to itching and erythema, depicting moist pustular ulcerated conditions and eczematous like eruptions. The term lepra, from the Greek words “lopos” (Greek: λόπος, the epidermis) and “lepo” (Greek: λέπω, remove the outer layer), referred to scaly conditions, while leichen represented skin growths held on by adhesion to the base (5, 18). So, intertrigo was classified as a “psoriasic” dermatological disease and physicians proposed the treatment of so called neonatal psora, as soon as it appeared (6).

Since environmental interaction with the human’s body homeostasis has been known from the Hippocratic era (6), there is a great possibility that Soranus of Ephesus and Paul of Aegina differentiated intertrigo from allergic and irritant contact dermatitis, which usually presented with more intense pruritus and signs of eczema (from the Greek words “εκ”: over, “ζε”: boiling, and “μα”: result of, thus describing a more superficial reaction), a more severe condition than the simple erythematous lesion of intertrigo. Thus, in cases of eczema, they suggested “hot pads with a rich suffuse of boiled olive oil are useful, mixed with a small quantity of melted wax in order for the mix to be thicker, for longer adherence” (19, 20).

A series of herbs were harnessed by the Greeks in antiquity to treat neonatal intertrigo (Figure 1). Among them, “Myrtus communis” (Greek: Μύρτος ο κοινός) of the family “Myrtaceae” represented the main ingredient for preparations against cutaneous affections. It is an aromatic evergreen perennial shrub or small tree, with small foliage and deep fissured bark. Its name, “Myrtus”, signifies a common plant growing in groups. Myrtle occupied a prominent place in the writings of Hippocrates, Pliny (23-79), Dioscorides, Galen and the Arabian writers. According to them, the leaves and fruit were therapeutic for several diseases, including intertrigo (21-23). Nowadays, Myrtle is known to have antibacterial and antifungal properties, which exhibit remarkable activity against several fungal strains (24). Cyperus Rotundus, (Greek: κύπερος) of the “Cyperaceae” family, was used from the Mycenaean era as a purifying agent, a skin reviving, healing factor, and herb regulator of the body’s humours (blood, phlegm, yellow bile, black bile) (13, 25). It is now known that Cuperus has antibacterial activities against Staphylococcus epidermidis, Bacillus cereus, Pseudomonas aeruginosa, Escherichia coli (26). “Lycium barbarum” (Greek: Λυκόμουρο, from the ancient southern Anatolian region of Lycia) was also widely used by the ancient Greeks as an anti-inflammatory agent (9). Flavonoids isolated from Lycium barbarum fruits have anti-inflammatory and anti-angiogenic effects (27). “Plumbago capensis” (Greek: μπλε Γιασεμί), of the “Plumbaginaceae” family, was used for the wood’s healing capacities, which are appreciated even now, as well as its antibacterial properties, especially against Staphylococcus aureus (28). Furthermore, some studies mention its strong antifungal activity, equivalent to that of voriconazole (29). Rose hip (ancient Greek: ρόδον, Greek: κυνόροδον, Latin: rosa canina) is today a product in cosmetics, included not only among the fragrance substances but also in skin conditioning agents (30). On the other hand, Punica granatum...
is proposed as an anti-infection and anti-worm killer in modern female cosmetics (31). Meanwhile, “Heleborus niger” (Figure 2) for the ancient Greeks was a herb widely used against mild and severe skin diseases, from intertrigo to leprosy (32).

Strangely, the perennial plant is nowadays considered to be poisonous, while especially its roots may cause a skin irritation and blistering. In medieval Europe it was used in a small dosage as an anti-parasite drug (33). There is the possibility that there was another
species in Greek antiquity, less irritating than the “Helleborus niger” noted by Paracelsus, or it was perhaps used in poultices, or after some process which could have altered its side effects. It seems that Greek physicians in antiquity, experts in botany, observed nature and the properties of herbs, used them to treat intertrigo in the form of
cataplasms, and practised dermatology in an almost scientific manner.

Thalassotherapy, introduced by the ancient Greeks, is a method still in use. A hypertonic solution of sea water penetrates skin lesions. Trace elements of magnesium, potassium, calcium, sodium and iodide found in seawater are believed to be absorbed through the skin. Thalassotherapy was applied in various forms: as showers of warmed sea water, inhalation of sea fog, or fumigation (34).

White lead powder was completely abandoned during the Byzantine era due to several deaths provoked by slow lead poisoning, a situation already known at least during the age of Pliny (23-79), and it was replaced by chalk powder, a soft, white, porous, sedimentary carbonate rock, a form of limestone, composed of the mineral calcite, well-known for its use in cosmetics in Greek antiquity (35). This powder, believed to have astringent properties, also had the ability to absorb moisture locally, but was also used as a base for the preparation of cataplasms. It was used extensively in the Byzantine era in the treatment of intertrigo, skin ulcers and burns (6, 36-38). Litharge (lead monoxide) was used as a lytic agent in tumour formations, and as a healing agent in skin ulcerations and intertrigo. Dioscorides believed that it also had the property of promoting cicatrisation, and it was also proposed as an anti-wrinkle agent and skin whitener in cases of melasma (9, 13, 39-41). Surprisingly, honey and olive oil, which were used in several cosmetic and skin preparations in antiquity, were completely neglected in the treatment of intertrigo (6). Finally, it is worth mentioning that the ancient Greek and Byzantine physicians’ treatment for intertrigo (Table 1) was adopted in the medieval period by the Orthodox Monasteries in Russia, which operated as health centres (42).

Conclusion

The most significant medico-philosophers of Greek antiquity mentioned neonatal intertrigo, and suggested herbal and mineral based therapeutic approaches, thus proving not only their knowledge of pharmacology, but also their rationalism in the treatment of skin diseases. Similarly, preventive and curative measures for this type of dermatitis, initially mentioned in ancient Greek medical texts, continued in the Byzantine era and have surprisingly survived until the present day in the treatment of intertrigo.

What is already known on this topic

Intertrigo primarily affects neonates and infants. Neonatal intertrigo is a well studied entity, known since antiquity. Its causes, symptoms and treatment have all been adequately researched.

What this study adds

Our knowledge concerning intertrigo in Greek antiquity is somehow vague. This historical review gathers and sheds light on the available knowledge in the treatises of ancient Greek and Byzantine medico-philosophers. A comparison between ancient and modern treatment surprisingly reveals strong similarities.
